

Upper Assendon Farm — M J Hunt & Son

Grain Storage Strategy & Records Pack

Combinable Crops & Sugar Beet · Updated 24 September 2026 with live records

Part 1 — Grain Storage Strategy

- Store type: on-floor grain store ("UAF cornstore") split into two bays, LHS and RHS, plus a lean-to used for Ahiflower, with underfloor cooling/drying fan (no heated continuous-flow dryer on this holding).
- Strategy: grain is brought in at harvest moisture, spread and cooled using the underfloor fan; moisture and temperature are checked regularly during storage to catch heating or damp spots early.
- Target moisture for safe storage: ~14.5% for wheat. 2026 harvest went into store at 13% moisture across both bays — comfortably below target and unchanged since intake, so currently low risk.
- Monitoring frequency: cornstore checked every 2 weeks (confirmed by James, 24 Sep 2026).
- Cleaning: store swept out and blown through between harvests before new grain goes in (see cleaning log below).
- Pest control: covered by the farm's vermin control programme (see Vermin Control Annual Site Survey).
- Traceability: variety and intake bay logged so grain in store can always be identified (see current bin contents and mass balance below).

Current bin contents (as of 24 September 2026)

Bay	Contents	Approx. tonnes
RHS	Ultimatum wheat (from Hollandridge, at the back) + Wildfarmed blend (at the front)	400
LHS	Remainder of the Ultimatum wheat + Diamond wheat (from BK)	500 at intake — 176t moved to Heygates w/c 15 Sep, current ≈324
Lean-to	Ahiflower — dried below 9% moisture, due to move off-farm next month	≈200

Off-farm movement note: the farm does not self-haul grain on public roads — all collections are made by the buyer's own transport (Heygates, Wildfarmed, or Ahiflower's contractor), so farm trailers are not used for sheeted/marked off-farm grain deliveries. Farm trailers are only used for in-field/yard cartage.

Part 2a — Grain Store Monitoring Log (moisture & temperature)

Date	Store/bin	Moisture %	Temperature	Checked by	Action taken
Intake, harvest 2026	LHS & RHS	13%	Mid-20s °C	James	Fan run to begin cooling
24/09/26	LHS & RHS	13% (unchanged)	12°C	James	None — cooling as expected, on track for single figures with cooler nights

Part 2b — Moisture/Temperature Probe Calibration Record

Date	Probe/equipment	Calibration method	Result	Checked by
22/06/26	Grain store moisture probe	Checked against a known moisture sample	Accurate — no adjustment needed	James

Part 2c — Cooling/Drying Fan Maintenance Record

Date	Work done	Done by	Next service due
18/05/26	Fan checked ahead of harvest intake	James	Pre-harvest 2027

Part 2d — Grain Store Cleaning Record

Date	Store/bin cleaned	Method	Cleaned by
19/05/26	LHS & RHS (whole store)	Swept out and blown through	James

Part 2e — Equipment Cleaning Record (combine, trailers, handling equipment)

Date	Equipment	Reason	Cleaned by
02/06/26	Combine	Pre-harvest service	Teide
11/06/26	All trailers	Pre-harvest clean & grease	Charlie

Part 2f — Grain Store Mass Balance (stock reconciliation)

Date	Crop/variety	Tonnes in	Tonnes out (sold/moved)	Running balance	Checked by
Harvest 2026	LHS — Ultimatum + Diamond (BK)	500	—	500	James
~15–19/09/26	LHS — Group 1 milling wheat, 6 loads to Heygates	—	176	324	James
Harvest 2026	RHS — Ultimatum (Hollandridge) + Wildfarmed blend	400	—	400	James
Harvest 2026	Lean-to — Ahiflower (dried <9%, due off-farm next month)	≈200	—	≈200	James

Keep adding a new row every 2 weeks (or whenever grain moves) so this stays a live record through to the 1 October inspection and beyond.
