

Grain Storage Strategy & Records Pack

Combinable Crops & Sugar Beet · Prepared 24 September 2026

This pack has two parts: (1) the written storage strategy, and (2) blank log sheets to start using immediately — even a few days of real entries before 1 Oct gives the assessor a live, working system rather than an empty policy.

Part 1 — Grain Storage Strategy

- Store type: on-floor grain store with underfloor cooling/drying fan (no heated continuous-flow dryer on this holding).
- Strategy: grain is brought in at harvest moisture, spread and cooled/dried using the underfloor fan; moisture and temperature are checked regularly during storage to catch heating or damp spots early.
- Target moisture for safe storage: [CONFIRM target %, typically ~14.5% for wheat/barley — set with agronomist if not already fixed].
- Monitoring frequency: cornstore checked every 2 weeks (confirmed by James, 24 Sep 2026).
- Cleaning: store swept out and cleaned between harvests before new grain goes in (see cleaning log overleaf).
- Pest control: covered by the farm's vermin control programme (see Vermin Control Annual Site Survey).
- Traceability: variety and intake dates logged so grain in store can always be identified (see Traceability checklist).

Part 2a — Grain Store Monitoring Log (moisture & temperature)

Date	Store/bin	Moisture %	Temperature	Checked by	Action taken

Part 2b — Moisture/Temperature Probe Calibration Record

Date	Probe/equipment	Calibration method	Result	Checked by

Part 2c — Cooling/Drying Fan Maintenance Record

Date	Work done	Done by	Next service due
