Herd Health Plan

Farmer	James Hunt
--------	------------

Farm Name		Upper Assendon Farm
Farm Address		Stonor, RG96HE
CPH Number		33/227/0030
Preferred method of contact		James Hunt – 07989294737 (text and email)
Stock Numbers and Type	Cattle	Bulls: Wagyu – 2 senior and 5 junior (all homebred) Cows & breeding heifers: 65 (predominantly Wagyu breeding and looking to create a more uniform Wagyu herd to ensure consistency in the marbling of the finished product) Followers: approx.80
	Other Enterprises	Arable

Production Aims	To produce 60-65 Wagyu X calves per year and take them through to finish under the Warrendale scheme.
------------------------	---

Capital Investments	No future investments are planned at present.
----------------------------	---

People who administer medicines	James Hunt
--	------------

Health Plan completed by	Adelle Jenkins BVSc GPCertFAP MRCVS
Date	30/7/26
Signed	
Date of next review	July 2027

Disease status overview

Lice	absent		Liver fluke	absent
Ticks	absent		Rumen fluke	absent
Mange	absent		Lungworm	absent
IBR	no recent testing		White drench resistance	no anthelmintics used for 10 years
BVD			Yellow drench resistance	
Johne's			Clear drench resistance	
Neospora			Triclabendazole resistance	
Leptospirosis				

Digital dermatitis	absent			
TB	under restriction			

No routine internal parasite monitoring or treatment – no signs / evidence of disease

Herd Health Priorities

Copper toxicity in pre-weaned calves – an apparent issue for 2-3 years. Evidence of liver changes consistent with copper toxicity in PM summer 2024. A few clinical cases (scour, poor condition, thin) in spring 2025, no deaths this year. Plan is to reduce access to copper in minerals when calves are very young, i.e. raise the minerals up off the ground or consider magnesium only licks for cows.

TB – Clear for the last four tests.

Red Tractor 2025 Updates

Details of Colostrum Policy (if applicable)

Observed suckling, Wagyu calves are very vigorous and calving difficulties are very rare. Rule of thumb: 20 mins sustained suckling within the first 6 hours of life should ensure adequate colostrum intake

Method to identify treated animals

Details entered on computer software and in records book

Pain relief policy

Metacam is given to any animal showing signs of pain, swelling, inflammation and particularly in cases of lameness or pneumonia

TB reactor policy – include individual animals and business contingency plan

Individuals are immediately isolated and APHA guidance is followed. All animals go direct to slaughter under the Warrendale scheme so there is no disruption to normal business operations

Infectious Disease

Details of BVD eradication plan

Youngstock check test due annually – consistently negative. 2025 test due at autumn TB test once animals reach the correct age.

IBR, Lepto, Johnes – health and performance figures very good, suggesting infectious disease unlikely. Test as necessary after discussion with the vet.

Foot Care and Lameness

In house foot trimming as required, lameness very rare, foot lifted for inspection and trimmed as necessary. NSAIDs such as Metacam given for pain relief.

Mastitis

Very rare – seek veterinary advice

Herd Calendar

Month	Stock	Action	Vet Input
January	Cows	Late Jan - Calving starts.	

February	Bulls	MOT – check feet, BCS (ideally 4), palpate testicles.	Could consider semen testing.
March	Cows	Late March - Finish calving. Address lame cows or poor feet.	
April	Bulls		
May		Bulls in.	
June	Cows	Watch for bulling activity, should be getting quiet.	
July	Bulls out Yearlings & Calves	Bulls out. FWEC*	Egg counting
August	Cows		
September	Yearlings & Calves	FWEC	Egg counting*
October			
November			
December	Whole herd	BVD blood sampling* and PD cows*	

Health & Performance Review – Cattle

Condition	No. Cases	No. Dead	Farmer Diagnosis	Vet Diagnosis	Interference Level
Infectious diseases					
BVD	0				-
Leptospirosis	0				-
Johne's	0				-
TB		20 reactors in last 12 months – a problem group of youngstock – now all slaughtered		-	
IBR	0				-
Parasites					
Liver fluke	0				-
Worms	0				-
Cow specific					
Abortion	0				>2%

Prolapse	0				>2%
Difficult calving	4				<5%
Barren	1				>7%
Mastitis	1				>3%
Still birth	0				2%
Ill thrift	0				10%
Metabolic disease	0				
Lameness	0				
Calf specific					
Pneumonia	0				5%
Scour	0				>5%
Ill thrift	3 (copper?)				>5%

Comments:

Excellent health, performance and fertility

Main issue copper toxicity and TB as already mentioned

98.5 calves reared per 100 females to the bull – really excellent herd performance – well done!

Herd Production Data

Medicines Purchase Inventory

Zero medicines purchased from Larkmead Vets in the 12 months leading up to 30/7/25

Antimicrobial Use = 0mg/kg PCU

I have reviewed data on the total antibiotic used, by product name and made the following recommendations to responsibly reduce the use of antibiotics where appropriate without negatively impacting animal welfare.

- No antibiotic purchases – no further recommendations

I have not prescribed the Highest Priority Critically Important antibiotics on this farm in the last 12 months.

Antibiotics have not been used prophylactically on this farm in the last 12 months.

Medicines Use Under the Veterinary Cascade = Not Applicable

Purchase policy – Biosecurity

The only cattle being purchased are replacement stock bulls that come through the Wagyu scheme from high health status farms

Disease	Recommendation
BVD	High health herd scheme accredited. Tag and testing ideally.
Lepto	High health herd scheme accredited. Annual blood testing.
IBR	High health herd scheme accredited. Annual blood testing.
Johnes	High health herd scheme accredited. Annual blood testing.
TB	No TB in herd or neighbouring for at least 24 months. Check IBTB website.

Other recommendations and quarantine policy in SOPs

Record of Farmer Training

Course	Attendee	Date	Deliverer

Attendance on medicines course is required every 5 years

Routine Husbandry – see SOPs

Castration – rubber ring <7 days of age, NSAIDS and local anaesthetic required

Disbudding – hot iron under local anaesthetic and NSAIDS
